

Molecular Evolution	
Course Code:	DIC 8007
Credits	Three (lectures: 3 hr per week)
Organizers	Shih-Ying Hwang
Lecturers	Daryi Wang · Arthur Chun-Chieh Shih · Chih-Horng Kuo · Ryuji Machida · Shu-Miaw Chaw, Trees-Juen Chuang, Kinya Ota
Time	Friday 09:10-12:00
Place	2F Conference Room, Biodiversity Research Center, AS
Prerequisites	Population Genetics and Evolution
Remark	Under 20 students
Description	Evolutionary analyses are increasingly important in many different fields of biological research, particularly as advances in molecular genetic techniques have made large DNA sequence data sets readily available. This course covers the basic concepts of evolutionary analysis and their application in fields such as systematics, comparative biology, and molecular evolution. Lectures will emphasize the logical basis and computational details of various algorithms and associated methods of hypothesis testing, as well as novel applications of phylogenetic analysis in various fields of biology.
Purpose	<ol style="list-style-type: none"> 1. Students will learn the dynamics of evolutionary change at the molecular level, the driving forces govern the evolutionary process, the effects of the various molecular mechanisms on the structure of genes, proteins, and genomes, the methodology involved in dealing with molecular data from an evolutionary perspective, and the logic of molecular hypothesis testing. 2. Students will identify an area of interest and propose research to answer an outstanding question in that area.

Week	Date	Topic
Week 1	2/22	Genes, genetic codes, and mutation (R. Machida) This chapter provides some basic background in molecular biology that is required for evolutionary process at the DNA level.
Week 2	3/1	Dynamics of genes in population I (D. Wang) Understand the genetics changes and its evolution patter in population. Introduce the neo-Darwinian theory and the neutral mutation hypotheses.
Week 3	3/8	Dynamics of genes in population II (D. Wang) Examples and papers associated with population genetics for discussion.
Week 4	3/15	Evolutionary change in nucleotide sequences (Arthur Shih) Introduce nucleotide substitution in a DNA sequence. In this lecture, we will study the Jukes and Cantor's on parameter model and Kimura's Two parameter model.
Week 5	3/22	Estimating the number of nucleotide substitutions between sequences (Arthur Shih) In this lecture, we will study different models in calculating substitution rate.
Week 6	3/29	Comparative and evolutionary genomics I (T. Chuang) After understanding the first section, we will discuss some evolutionary arguments associated with alternative splicing and gene duplication.
Week 7	4/5	Holiday
Week 8	4/12	Comparative and evolutionary genomics II (T. Chuang) This lecture will introduce post-transcriptional events such as cis-splicing, trans-splicing, and RNA editing.
Week 9	4/19	Mid-term exam (D. Wang)
Week 10	4/26	Molecular clocks (Arthur Shih) We will introduce the definition of molecular clock and relative rate test.
Week 11	5/3	DNA polymorphism in populations (R. Machida) Introduce the methods to measure DNA polymorphism and how to detect natural selection.

Week 12	5/10	Gene duplication, exon shuffling I (SM Chaw) Gene duplication has been recognized to be the main role in evolution. In the lecture we will introduce 5 different types of gene duplication. Also, we will study the definition of Exon and types of domain, and discuss the mutation meaning in evolution.
Week 13	5/17	Gene duplication, exon shuffling II (SM Chaw) Introducing recent papers associated with gene duplication.
Week 14	5/24	Concerted evolution (K. Ota) Introducing evo. devo.
Week 15	5/31	Evolution by transposition (C.H. Kuo) In this lecture, we will describe the myriad of transposable genetic elements that facilitate the movement of genetic material from on genomic location to another. We will study the impacts that may have had on the evolutionary process.
Week 16	6/7	Genome evolution (C.H. Kuo)
Week 17	6/14	Discussion (TY Wang)
Week 18	6/21	Final exam (C.H. Kuo)
